

Thematic Group: Public Communication	
Focus Group: 3.1. Media and Institutional Communication	
Scenario: Alert (yellow traffic-light level)	
Dimension	Contributions
Official Communication Channels	- Pay special attention to media outlets with a presence in the Canary Islands, due to their knowledge of the territory, prior experience, and specific training in emergency management - Prioritize collaboration with public media, radio stations, television, and professionals specialized in scientific outreach and risk communication - Create a prior certification or accreditation system for media outlets that have participated in courses, drills, or previous emergencies - Assess, in this accreditation, demonstrated experience, coordination with the scientific committee, and the quality and rigor of the information published - Publication, by the Directorate General for Emergencies, of an official list of accredited media outlets, with the aim of facilitating citizens' access to verified and reliable information during emergency situations - Include in this list accredited media outlets in other languages, to ensure accessible communication for the resident and visiting foreign population
Institutional Spokesperson Designation	- Establish a differentiated system of institutional and scientific spokespersons, defining spokespersons agreed upon by each organization or scientific team, as well as political spokespersons linked to PEVOLCA. In the case of scientific spokespersons, it is proposed that they have continuous operational availability, outreach capacity to adapt technical language to the population, and specific training in both public communication and the volcanic phenomenon
Alert Message Standards	- Ensure that official communication uses clear, accessible, and understandable language, prioritizing Spanish in audiovisual media and complementing it with accessibility and inclusion mechanisms, such as subtitles in other languages, sign-language interpretation, or QR codes with access to multilingual information
Public Communication Effectiveness	- Messages should incorporate basic information on the phenomenon, self-protection measures, responsible actors, and explicit reference to official sources - Design brief, calm, and contextualized institutional messages capable of communicating the evolution of the phenomenon, foreseeable scenarios, and specific recommendations adapted to the different risk areas, avoiding the generation of unnecessary alarm
Inter-Institutional Communication Coordination	- Create an institutional press unit responsible for coordinating the spokespersons of the different organizations, harmonizing messages, acting as a liaison between administrations and the media, and supervising accreditation systems

Thematic Group: Public Communication	
Focus Group: 3.2. Education, Tourism, and Society	
Scenario: Alert (yellow traffic-light level)	
Dimension	Contributions
Identification of Priority and Vulnerable Groups	- Explicitly incorporate groups such as homeless people and migrants - Adapt tourism communication by differentiating between people staying in hotels, vacation rentals, and temporary residents - Ensure that information has an influence both at the origin and at the tourist destination - Incorporate people linked to animals, including livestock farmers, pet owners, and the management of stray animals - Properly identify and differentiate the business sector, associations, collectives, and other entities involved - Rely on existing community structures and local networks to expand the reach of information
Multilingual and Accessible Communication Mechanisms	- Incorporate audiovisual and accessible formats such as videos, pictograms with unified criteria, QR codes, and infographics that facilitate population understanding and training - Use multiple dissemination channels: SMS, WhatsApp, Telegram, loudspeakers, public screens, social networks - Incorporate illustrated stories and visual materials adapted to different population profiles - Incorporate more local foreign media to improve the reach of information in tourist destinations - Verify that information is correctly reaching students and families in educational centers - Ensure common criteria for accessibility and inclusive communication - Explore and assess communicative harmonization mechanisms with European exercises and protocols such as EU-Modex
Risk Communication for Tourist and Foreign Populations	- Prepare clear, simple, and understandable messages for all groups, both visitors and residents - Consider not only hotel staff but also workers and critical infrastructure - Explain what is happening and what precautionary measures should be adopted - Incorporate information on mobility, daily routines, and travel planning in unaffected areas, recognizing the importance of everyday well-being - Incorporate specific self-protection and safety recommendations - Provide clear references to official information sources

Educational Communication Channels and Information Dissemination	- Update and diversify the communication channels used in the educational field - Incorporate loudspeaker systems and specific channels such as the FPP Channel - Ensure that each educational center checks how information is reaching families and students - Strengthen drills and mechanisms for monitoring preventive communication
Accessible Communication for Elderly and Digitally Vulnerable Populations	- Incorporate information screens in public transport and everyday-use spaces - Strengthen training aimed at caregivers and support persons - Ensure that information is accessible to all social and functional diversity - Prioritize simple and visual communication formats, such as pictograms and infographics, to facilitate understanding

Thematic Group: Public Communication	
Focus Group: 3.3. Safety and Civil Protection	
Scenario: Alert (yellow traffic-light level)	
Dimension	Contributions
Security Forces and Institutional Verification of Information	- Design messages with a common body of information, adapted to the characteristics of the environment and always accompanied by references to official information channels - Incorporate key local informants and relevant organizations —both local and international— in the dissemination of messages aimed at the population - Strengthen the participation of territorial actors such as local development agents, mayors, councilors, local Red Cross assemblies, parishes, and predominant local associations in preventive communication and information-verification processes - Link these functions with specific training and capacity-building sessions for local informants connected to the PAIV
Detection and Monitoring of Rumors and Misinformation	- Establish official points for receiving information from citizens and organizations about rumors or hoaxes in circulation - Develop mechanisms for analyzing and evaluating detected hoaxes, assessing the risk and possible severity for the population
Official Response and Rumor Management Procedures	- Identify, analyze, and assess the scope and severity of detected hoaxes - Evaluate severity from both a quantitative perspective —impact, number of publications, reach, or followers— and a qualitative perspective, considering the content and potential impact of the information disseminated - Based on this assessment, strengthen official communication on the affected issue or proceed with the specific debunking of the hoax when its severity requires it
Institutional Rectification and Public Correction Mechanisms	- Consider the creation of specific channels or the designation of responsible persons for the management and rectification of false information - After analyzing the scope and severity of the hoax, strengthen the dissemination of verified information or proceed with an official debunking when necessary
Rapid Local Coordination for Territorial Communication	- Incorporate local actors and proximity-based territorial networks —local development agents, mayors, councilors, local Red Cross, parishes, and community associations— in the rapid dissemination of official messages - Link these territorial coordination mechanisms with prior training and capacity-building processes for local informants associated with the PAIV

Thematic Group: Public Communication	
Focus Group: 3.4. Local Authorities and Technical Staff	
Scenario: Alert (yellow traffic-light level)	
Dimension	Contributions
Community Communication Channels	- Strengthen door-to-door strategies and loudspeaker systems - Promote talks and training in neighborhood associations, schools, business associations, and hotels, preferably from the green alert level - Use strategic dissemination and information points such as supermarkets and pharmacies - Incorporate signage, local radio, web pages, social networks, and WhatsApp groups or broadcast channels
Municipal Communication Responsibilities	- Check the proper functioning of the municipal centers and structures involved in communication - Strengthen specific training for municipal staff in communication and emergency management

Local Community Risk Messaging	- Prepare clear, concise, and easily understandable messages - Incorporate practical preparedness and self-protection recommendations - Include indications on important documentation, necessary medication, and availability of cash
Public Alert Signage and Accessibility	- Include essential information in a clear and visually striking way - Incorporate emergency contacts - Ensure linguistic accessibility and accessibility for people with disabilities
Municipal–PAIV Information Coordination	- Establish bidirectional communication mechanisms between municipalities and the PAIV Information Office - Hold periodic update and coordination meetings - Incorporate specific recommendations adapted to each municipal plan - Have alternative channels available in the event of possible failures of the main systems - Define in advance the priority and most necessary channels for each territorial context.

Thematic Group: Public Communication	
Synthesis of the Thematic Group	
Scenario: High-Alert (orange traffic-light level)	
Dimension	Contributions
General ideas	- Need to develop implementation actions in stages prior to the Alert and High-Alert situation
Institutional coordination and communication	- Strengthen inter-administrative coordination for the planning and execution of preventive evacuations. In this context, the use of alternative communication channels —such as Telegram or WhatsApp— restricted to official management groups is proposed in order to facilitate operational coordination among organizations during the emergency - Establish a single official message from which the self-protection plans of essential services and the different sectors involved can be activated, also incorporating links or hyperlinks to a web platform with permanently updated official information - Organize the information available on that platform by sectors or thematic areas —education, tourism, agriculture, among others— and adapt it to the different recipient profiles and needs of the population
Message adaptation	- Properly communicate the uncertainty associated with the volcanic phenomenon and the existing limitations in forecasts, avoiding the generation of unnecessary alarm among the population - Strengthen coordination with local informants and community networks, while also promoting a proactive role for these actors in the dissemination and contextualization of information - Ensure communicative accessibility through the incorporation of different languages, pictograms, illustrations, and other visual resources that facilitate understanding of messages - Accompany the information with specific guidance on available resources and the differentiated needs of each group, especially in the case of vulnerable populations, tourists, or temporary residents - Adapt messages to the different social profiles, sectors, and territorial contexts affected by the emergency - Repeatedly remind people of the importance of using only official sources and verifying the information received - Adjust the content and intensity of messages according to the degree of misinformation or circulation of rumors detected at any given time - Normalize the emotional reactions of the population during emergency situations, while also facilitating free access to qualified psychological and emotional support personnel

Media, channels, and communication mechanisms	- Ensure the participation of official media outlets that are trained and coordinated with public administrations to ensure the dissemination of verified and rigorous information during the emergency - Strengthen the institutional communication channels of municipalities, the Cabildo, and the Government of the Canary Islands, promoting a coordinated and coherent strategy among administrations - Complement the usual channels with alternative dissemination means, such as radio, loudspeakers, drones, or SMS alert systems, especially in scenarios of network failure or difficulties in accessing information - Activate and make use of existing strategic points in municipalities for the installation of signage and loudspeaker systems, optimizing the local infrastructure available for alert communication - Recognize the role of children as a fundamental channel for transmitting information to families, promoting educational projects and the development of a Civil Protection Emergency Training Plan in non-university educational centers linked to the LOMLOE - Create and strengthen networks of local informants, key informants, and community actors capable of facilitating the territorialized and contextualized dissemination of official information - Incorporate direct links to web pages and official sources of updated information in alert messages sent by SMS - Adapt communication channels and formats to the needs of vulnerable groups, relying on existing institutional networks and structures, such as the Cabildo Volunteer Offices, the Island Office for Older Adults, or the Youth House Network - Rely on the communication networks and resources of the Armed Forces and the State Security Forces and Corps to strengthen operational capacity and the dissemination of information during the emergency
General recommendations for evacuation and remaining municipalities	- Differentiate population segments according to the planned evacuation and their proximity or distance from the areas of greatest risk and impact - Recall and activate the self-protection plans of the different sectors and essential services involved in the emergency - Inform the population about family self-protection measures, including aspects related to medicines, health cards, personal documentation, housing, animals, and basic safety measures - Incorporate a multi-risk perspective that considers possible derived threats in other areas of the island —and even on other islands— as a consequence of the eruptive phenomenon - Provide information on potential risks and expected dynamics in the rest of the island territory, promoting citizen self-protection and better emergency management - Strengthen coordination with PROMOTUR and Turismo de Tenerife (TURISMOTF) to develop specific communication and safety protocols aimed at managing possible pull effects or unnecessary movements - Officially centralize and channel volunteer management, adequately organizing citizen demand and participation during the emergency - Strengthen institutional capacity to reaffirm and disseminate reliable information through official and verified sources - Create a specific unit for the analysis, monitoring, and management of hoaxes and misinformation - Improve communication related to maritime traffic by incorporating information on restrictions, safety measures, and associated risks
