

THEMATIC GROUP	ANALYTICAL DIMENSION OF RISK GOVERNANCE
	MULTILEVEL INTERACTIONS
	Vertical coordination, distribution of authority and responsibilities, interaction across scales, decision-making and information flows, and articulation between formal coordination structures and multiple decision-making centers
	Incorporate coordination mechanisms with the different health and social-health care resources in the territory (Canary Islands Health Service, Health Areas, IASS, social-health care centers, and accommodation establishments, among others), in order to have a comprehensive assessment of the needs of the potentially affected population
	Review in a coordinated manner those operational issues identified as requiring improvement in the PAIV that originate in higher-level planning instruments, in order to ensure coherence among the different emergency and civil protection plans
	Strengthen coordination with security and traffic management units to facilitate the orderly implementation of assisted evacuation operations
	Incorporate into the PAIV a detailed description of the coordination and management mechanisms for meeting points and pickup points, including the distribution of functions among administrations
	Specify the minimum human, material, and logistical resources that municipalities must have available for setting up and managing meeting points
	Detail the procedures and transportation resources needed to transfer people from pickup points, including the definition of responsibilities among the competent administrations
	Analyze the operational capacity of ports located in risk areas for their use as evacuation points for people and entry points for emergency resources
	Strengthen coordination with tourism organizations on other islands to facilitate temporary accommodation alternatives for tourists who cannot remain on the affected island and who do not wish to return to their places of origin
	Explicitly incorporate the functions and responsibilities of the specialized organizations responsible for animal management and care during evacuations
	Determine in advance alternative destinations for the temporary relocation of evacuated animals, including receiving farms, public facilities, and other resources enabled for that purpose
	Explicitly designate the figure responsible for coordinating the Cabildo security group
	Incorporate a clearly identified point of contact to facilitate communication, resource mobilization, and coordination among the response organizations
	Incorporate the coordination of evacuation among institutions, which should be established according to jurisdiction (State Security Forces and Corps)
	Establish permanent communication mechanisms between the scientific committee and operational organizations to convey updated recommendations on risks, preventive measures, and safety conditions
	Review the model for organizing security in evacuated areas, defining differentiated functions for the different police forces and emergency organizations in order to avoid duplication and ensure a clear distribution of responsibilities
	Ensure coordination among security, logistics, and human resource management units by establishing personnel relief and rotation systems adapted to the operational needs of the emergency (shifts of 2 to 4 hours are proposed)
	The role of municipal grouping units comes into play: municipal units that facilitate the evacuation of small dispersed or isolated population groups. There should be a directory of drivers to perform this function up to the established meeting point. An initial registration is carried out by an intervention staff member
	A directory of evacuation resources should be implemented with TITSA and possible private means with which collaboration for evacuation may need to be established
	Assign to the health coordination officer of the Advanced Command Post (ACP) the management of the resources needed for assisted evacuation, including requests for transportation, logistical support, escorts, and any other resource required to ensure safe transfers. The route established by the Local Police is followed
	Ensure that coordination of assisted evacuation is carried out centrally from the Advanced Command Post (PMA), with support from CECOES 112 when the scale or complexity of the emergency so requires
	ACTORS AND NETWORKS
	Diversity of actors and participation, cooperation among actors, shared learning, distributed leadership, and network governance
	Incorporate coordination mechanisms with the different health and social-health care resources in the territory (Canary Islands Health Service, Health Areas, IASS, social-health care centers, and accommodation establishments, among others), in order to have a comprehensive assessment of the needs of the potentially affected population
	Strengthen coordination with security and traffic management units to facilitate the orderly implementation of assisted evacuation operations
	Strengthen coordination with tourism organizations on other islands to facilitate temporary accommodation alternatives for tourists who cannot remain on the affected island and who do not wish to return to their places of origin
	Explicitly incorporate the functions and responsibilities of the specialized organizations responsible for animal management and care during evacuations
	Improve the internal dissemination of the operational designations and responsibilities set out in the plan, ensuring that all organizations involved know the reference persons and the established coordination channels
	Establish permanent communication mechanisms between the scientific committee and operational organizations to convey updated recommendations on risks, preventive measures, and safety conditions

EVACUATION	Ensure coordination among security, logistics, and human resource management units by establishing personnel relief and rotation systems adapted to the operational needs of the emergency (shifts of 2 to 4 hours are proposed)
	Ensure sufficient availability of provisioning resources and personal protective equipment (PPE) for intervening personnel
	A directory of evacuation resources should be implemented with TITSA and possible private means with which collaboration for evacuation may need to be established
	Have an updated directory of hotels and vacation rentals that could receive evacuated visitors (vacation rentals are evacuated as local population)
	Integrate psychological care teams from the initial phases of the evacuation process, ensuring their presence at pickup points to provide emotional support and accompaniment to affected people and intervening personnel
	FORMAL AND INFORMAL INSTITUTIONS
	Formal rules, protocols, procedures, institutional legitimacy, informal arrangements, and institutional adaptation
	Develop specific information-collection tools that allow the social-health care situation of the population at risk to be characterized and facilitate evacuation planning
	Identify and analyze in advance the needs of vulnerable groups, including medical treatments, dependence on caregivers, specific dietary needs, mental health support, and other factors relevant to evacuation and sheltering
	Incorporate territorial and operational variables into evacuation planning, such as geographic location, housing type, availability of human and material resources, accessibility, and characteristics of the affected population
	Have updated information on the vulnerable population and their social-health care needs in order to prioritize assisted evacuation and ensure continuity of health and social care throughout the process
	Adapt regular routes and traffic systems to the specific needs arising from a preventive evacuation, ensuring traffic flow and population safety
	It is recommended that meeting points be large open areas
	Clearly and precisely define the differences between meeting points and pickup points, specifying their objectives and operational procedures
	Specify more clearly when each of the planned time frames is activated, defining its relationship with the different alert scenarios and the evolution of the volcanic phenomenon
	Incorporate objective criteria that allow certain evacuations to be anticipated before more severe scenarios are activated, taking into account the uncertainty inherent in eruptive processes
	Incorporate into the PAIV existing agreements, plans, or protocols related to the mobilization of collective transportation resources for evacuations
	Evaluate and incorporate maritime evacuation as an operational alternative in scenarios in which land routes may be compromised or isolated
	Establish specific protocols for activating and coordinating maritime evacuation and supply operations
	Broaden the scope of tourism planning by incorporating modalities not expressly considered in the PAIV, such as active tourism, excursions from other tourist areas, and vacation rentals
	Establish specific procedures for identifying, locating, and evacuating visitors staying outside traditional hotel establishments
	Specify in the PAIV the information and documentation requirements that must accompany evacuated animals, including identification, health history, veterinary treatments, and specific needs
	Develop the protocol provided for the evacuation and sheltering of companion animals whose owners do not have their own means of transportation
	Establish specific procedures for managing animals from animal protection centers and other sheltering facilities
	Complete and develop the specific production-animal evacuation plan included in the PAIV
	Maintain an updated census of livestock farms, species present, and number of potentially affected animals
	Identify in advance the farms that have their own evacuation resources and those that will require external support
	Prepare and update an inventory of available transportation means and logistical resources for the evacuation of production animals
	Define specific procedures for species whose management requires differentiated solutions, such as certain poultry or swine production systems
	Incorporate specific self-protection protocols for intervening teams, adapted to the different hazards associated with the volcanic phenomenon
	Break down and individually define the criteria used to locate traffic and access control devices. Avoid generalities in the PAIV
	Incorporate additional criteria that allow the location of control devices to be adapted to the specific characteristics of each emergency scenario
	Expand the network of shelters planned for emergency situations by incorporating additional infrastructure that allows the evacuated population to be better distributed
	Assess the incorporation of different types of reception infrastructure, sports halls, and other facilities with capacity to accommodate large population contingents
	Prioritize locating shelters in areas close to evacuation zones, provided that safety conditions allow, in order to expedite transfers and facilitate operational management
	Incorporate specific criteria for sheltering people accompanied by animals, promoting an appropriate distribution of accommodation resources
	Establish specific procedures for the protection of property, access control, and surveillance of evacuated areas

	Integrate remote surveillance technologies, such as drones, cameras, or other monitoring systems, for the supervision of areas that are difficult to access or pose high levels of risk for responders
	Incorporate these resources as a complement to in-person surveillance, especially in scenarios involving the presence of gases, high temperatures, or proximity to the eruptive phenomenon
	Provide resources for companion animals at pickup points
	Adapt transportation means to the current situation of the different patients
	Do not remove resources from regular service
	Prioritize assisted evacuation using assessment criteria that consider, first, the level of risk in the affected area, followed by the degree of mobility of the people involved and, subsequently, their health needs or specific medical conditions
	Incorporate into assisted evacuation planning operational variables such as the clinical profile of affected people, the condition and capacity of evacuation routes, proximity to the eruptive phenomenon, and meteorological conditions, in order to adequately estimate response and transfer times
	Establish as an operational reference a time horizon of between four and five hours to complete the evacuation of people requiring assistance, subject to the specific conditions of the emergency and the availability of resources
